# 第4章: 非参数方法

刘成林(liucl@nlpr.ia.ac.cn) 2015年10月21日

助教: 杨学行(xhyang@nlpr.ia.ac.cn)

吴一超(yichao.wu@nlpr.ia.ac.cn)

# 上次课主要内容回顾

- 特征维数与过拟合
  - 增加特征带来更多判别信息
  - 克服过拟合的方法?
- 期望最大法(EM)
  - 对数似然度对缺失数据的期望
  - EM for Gaussian mixture
- 隐马尔可夫模型(HMM)
  - Three basic problems
  - Viterbi Algorithm (DP)
  - Extensions

# 提纲

- 第4章 非参数方法
  - 密度估计
  - Parzen窗方法
  - K近邻估计
  - 最近邻规则
  - 距离度量
  - Reduced Coulomb Energy Network
  - Approximation by Series Expansion

# 密度估计

- 概率和密度
  - 概率: 特征空间中一定区域内样本的比率

$$P = \int_{\mathcal{R}} p(\mathbf{x}') \ d\mathbf{x}'$$

- 假设局部区域(体积为V, 样本数k)内等概率密度

$$\int_{\mathcal{B}} p(\mathbf{x}') \ d\mathbf{x}' \simeq p(\mathbf{x})V \qquad p(\mathbf{x}) \simeq \frac{k/n}{V}$$

- 如何决定局部区域的大小: 随样本数n变化
- $-p_n(\mathbf{x})$ 收敛到 $p(\mathbf{x})$ 的条件  $\lim_{n\to\infty}V_n=0$

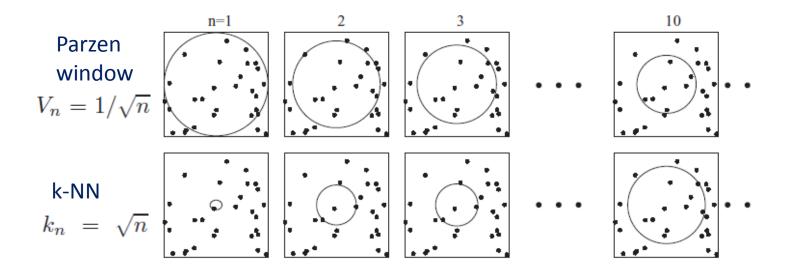

$$\lim_{n\to\infty} k_n = \infty$$

$$\lim_{n \to \infty} k_n / n = 0$$

## • 非参数概率密度估计

- Parzen window: 固定局部区域体积V, k变化
- k-nearest neighbor: 固定局部样本数k, V变化

(这里n不一定指样本数)

## **Parzen Window**

• 窗函数: hypercube

$$\varphi(\mathbf{u}) = \begin{cases} 1 & |u_j| \le 1/2 & j = 1, ..., d \\ 0 & \text{otherwise.} \end{cases}$$

- 满足条件

$$\varphi(\mathbf{x}) \ge 0$$
  $\int \varphi(\mathbf{u}) \ d\mathbf{u} = 1$ 

- 以x为中心、体积为 $V_n = h_n^d$ 的局部区域内样本数

$$k_n = \sum_{i=1}^{n} \varphi\left(\frac{\mathbf{x} - \mathbf{x}_i}{h_n}\right)$$

- 概率密度估计 $k_n/nV_n$ 

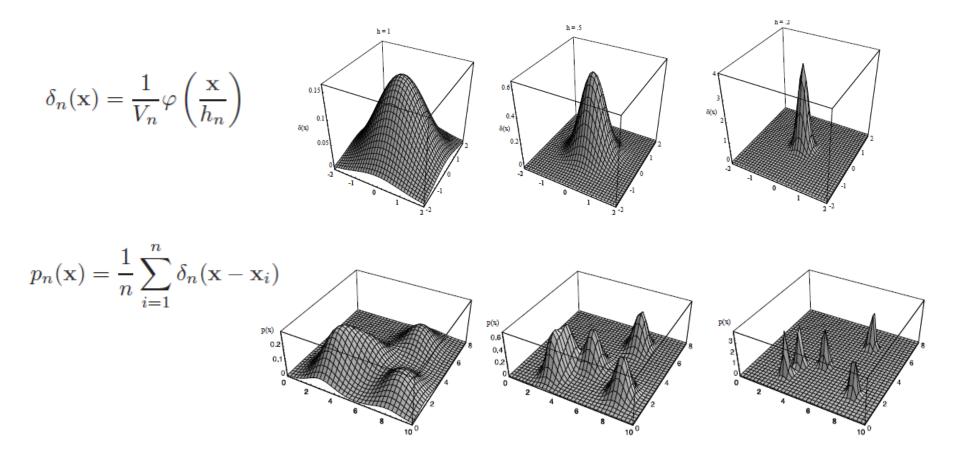

$$p_n(\mathbf{x}) = \frac{1}{n} \sum_{i=1}^n \frac{1}{V_n} \varphi\left(\frac{\mathbf{x} - \mathbf{x}_i}{h_n}\right)$$

• 推广:满足密度函数要求的窗函数,如高斯函数

$$\varphi(\mathbf{x}) \ge 0$$
  $\int \varphi(\mathbf{u}) \ d\mathbf{u} = 1$ 

#### Gaussian window, variable width (h=1, 0.5, 0.2)

Large h: low variability, under fitting

Small *h*: high variability, overfitting

- Parzen窗密度估计的收敛性
  - $-p_n(\mathbf{x})$ 的期望是 $p(\mathbf{x})$ 的平滑(卷积)
    - Samples  $\mathbf{x}_1,...,\mathbf{x}_n$  are i.i.d from  $p(\mathbf{x})$

$$\bar{p}_{n}(\mathbf{x}) = \mathcal{E}[p_{n}(\mathbf{x})]$$

$$= \frac{1}{n} \sum_{i=1}^{n} \mathcal{E}\left[\frac{1}{V_{n}} \varphi\left(\frac{\mathbf{x} - \mathbf{x}_{i}}{h_{n}}\right)\right]$$

$$= \int \frac{1}{V_{n}} \varphi\left(\frac{\mathbf{x} - \mathbf{v}}{h_{n}}\right) p(\mathbf{v}) d\mathbf{v}$$

$$= \int \delta_{n}(\mathbf{x} - \mathbf{v}) p(\mathbf{v}) d\mathbf{v}.$$

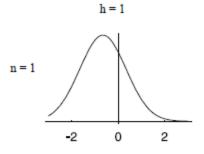

When 
$$n \to \infty$$
  $\lim_{n \to \infty} V_n = 0$   $\lim_{n \to \infty} n V_n = \infty$   $\overline{p}_n(\mathbf{X}) \to p(\mathbf{X})$ 

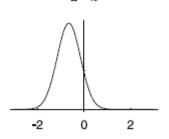

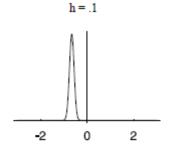

• 示例: 高斯窗函数  $\varphi(u) = \frac{1}{\sqrt{2\pi}} e^{-u^2/2}$ 

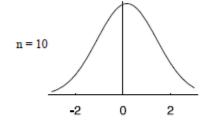

$$\varphi(u) = \frac{1}{\sqrt{2\pi}} e^{-u^2/2}$$

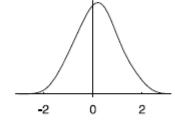

$$p_n(x) = \frac{1}{n} \sum_{i=1}^n \frac{1}{h_n} \varphi\left(\frac{x - x_i}{h_n}\right) \qquad \underline{h_n = h_1/\sqrt{n}}$$

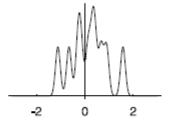

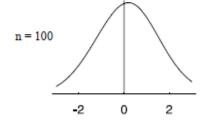

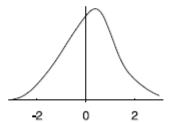

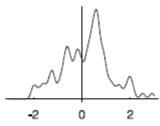

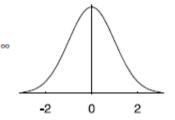

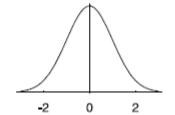

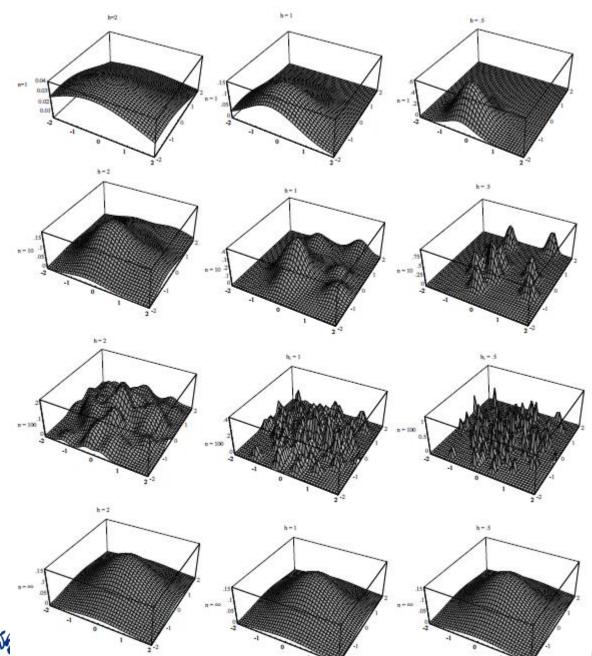

True p(x): Gaussian

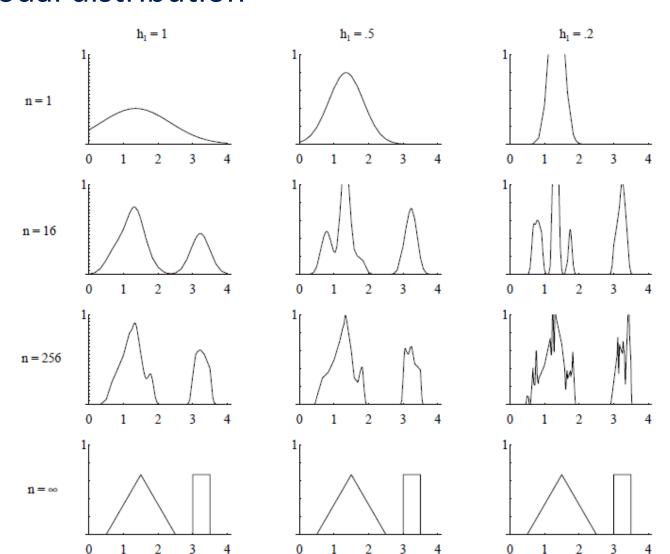

2D case h=2, 1.0, 0.5  $n=1, 10, 100, \infty$ 

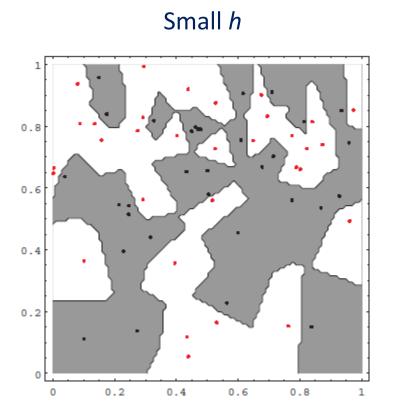

### Bimodal distribution

## • 分类的例子 $\max_{i} p(\mathbf{x} \mid \omega_{i}) P(\omega_{i})$

Large h 0.8 0.6 0.4 0.2 0.2 0.4 0.6 0.8

上部和下部密度区别大,适合不同的h值(考虑Generalization)

## • 窗宽hn选择经验

- 一般原则: n越大或密度越大,  $h_n$ 越小

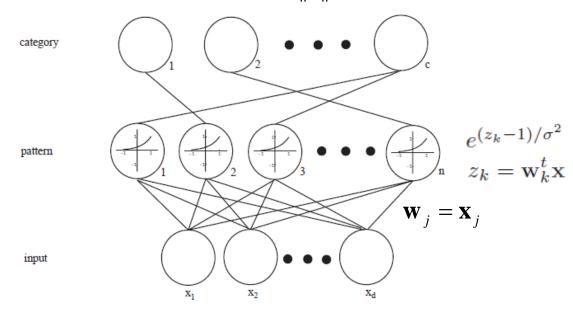

- 随n变化:  $V_n = V_1/\sqrt{n}$ 

- 随x变化: h(x), h(x<sub>i</sub>)
  - x测试样本, x,训练样本
  - 比如: 根据k-NN的距离判断
- 交叉验证(cross validation)
  - 比如选择V<sub>1</sub>

## Probabilistic Neural Network (PNN)

- 输出每个类别的概率密度
- 隐节点: pattern unit, 对应窗函数
- Normalized pattern:  $\mathbf{x}$  ←  $\mathbf{x}$  /  $\|\mathbf{x}\|$

Why 
$$e^{(z_k-1)/\sigma^2}$$
 
$$\varphi\left(\frac{\mathbf{x}_k - \mathbf{w}_k}{h_n}\right) \propto e^{-(\mathbf{x} - \mathbf{w}_k)^t (\mathbf{x} - \mathbf{w}_k)/2\sigma^2}$$

$$= e^{-(\mathbf{x}^t \mathbf{x} + \mathbf{w}_k^t \mathbf{w}_k - 2\mathbf{x}^t \mathbf{w}_k)/2\sigma^2} = e^{(z_k-1)/\sigma^2}$$

# K近邻估计

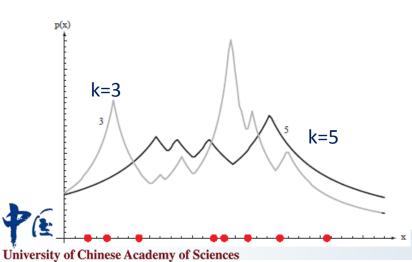

- 概率密度估计
  - 固定局部区域样本数k, 体积V变化

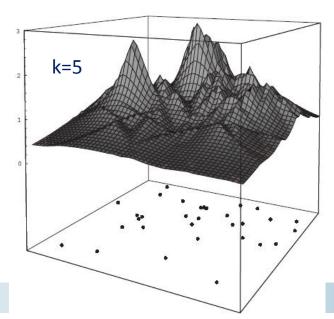

$$p_n(\mathbf{x}) = \frac{k_n/n}{V_n}$$

- 收敛到p(x)条件

$$\lim_{n\to\infty} k_n = \infty$$
 and  $\lim_{n\to\infty} k_n/n = 0$ 

- 种选择:  $k_n = \sqrt{n}$   $V_n \simeq 1/(\sqrt{n}p(\mathbf{x}))$
- 1D, 2D的例子

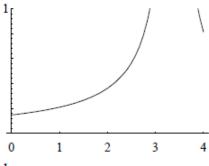

# More 1D examples

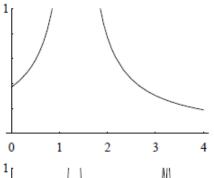

$$n = 1$$

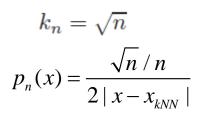

$$k_n = 1$$

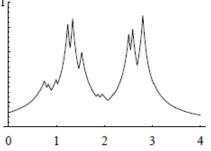

n = 16

 $k_n = 4$ 

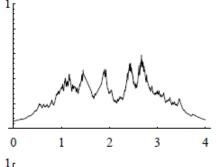

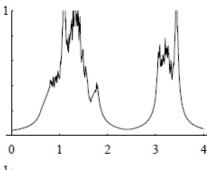

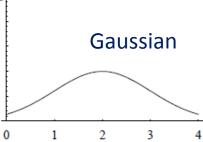

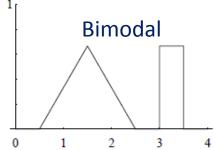

True  $p(\mathbf{x})$ 

• K-NN分类: 后验概率

- 
$$k_i$$
 NNs from class  $i$   $k = \sum_{i=1}^{c} k_i$ 

$$p_n(\mathbf{x}, \omega_i) = \frac{k_i/n}{V}$$

$$P_n(\omega_i|\mathbf{x}) = \frac{p_n(\mathbf{x}, \omega_i)}{\sum\limits_{j=1}^{c} p_n(\mathbf{x}, \omega_j)} = \frac{k_i}{k}$$

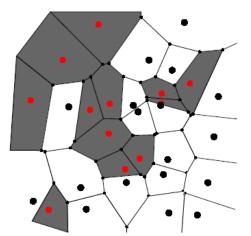

- 分类错误率: 当  $\lim_{n\to\infty} k_n = \infty$  and  $\lim_{n\to\infty} k_n/n = 0$  趋近贝叶斯错误率

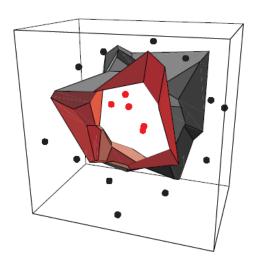

# 最近邻规则

- Nearest Neighbor (1-NN) Rule
  - Among labeled data  $\mathcal{D}^n = \{\mathbf{x}_1, ..., \mathbf{x}_n\}$ ,  $\mathbf{x}'$  is the NN of  $\mathbf{x}$
  - Assume  $P(\omega|\mathbf{x}') \simeq P(\omega_i|\mathbf{x})$
  - Classification: MAP

$$\omega_m = \arg\max_i P(\omega_i \mid \mathbf{x}) = \omega(\mathbf{x}')$$

Decision regions: Voronoi tesselation

## • 最近邻规则的错误率

$$\begin{split} P(e) &= \int P(e|\mathbf{x}) p(\mathbf{x}) \ d\mathbf{x} \\ P(e|\mathbf{x}) &= \int \underline{P(e|\mathbf{x}, \mathbf{x}')} p(\mathbf{x}'|\mathbf{x}) \ d\mathbf{x}' \\ \end{split}$$
 **x**': NN of **x**

- When n→∞, p(x'|x) approaches delta function centered at x
- For  $P(e|\mathbf{x},\mathbf{x}')$ , assume  $\mathbf{x}$  and  $\mathbf{x}_n'$  (nearest training sample, independent) are associated with class variables θ and  $\theta_n'$ , respectively

$$P(\theta, \theta'_j | \mathbf{x}, \mathbf{x}'_j) = P(\theta | \mathbf{x}) P(\theta'_j | \mathbf{x}'_j)$$

$$P_n(e | \mathbf{x}, \mathbf{x}'_j) = 1 - \sum_{i=1}^c P(\theta = \omega_i, \theta' = \omega_i | \mathbf{x}, \mathbf{x}'_j) = 1 - \sum_{i=1}^c P(\omega_i | \mathbf{x}) P(\omega_i | \mathbf{x}'_j)$$

$$\lim_{n \to \infty} P_n(e|\mathbf{x}) = \int \left[ 1 - \sum_{i=1}^c P(\omega_i|\mathbf{x}) P(\omega_i|\mathbf{x}') \right] \underline{\delta(\mathbf{x}' - \mathbf{x})} \ d\mathbf{x}' = 1 - \sum_{i=1}^c P^2(\omega_i|\mathbf{x})$$

Asymptotic error rate

$$P = \lim_{n \to \infty} P_n(e)$$

$$= \lim_{n \to \infty} \int P_n(e|\mathbf{x})p(\mathbf{x}) d\mathbf{x}$$

$$= \int \left[1 - \sum_{i=1}^{c} P^2(\omega_i|\mathbf{x})\right]p(\mathbf{x}) d\mathbf{x}$$

#### Error bound of 1-NN rule

$$\sum_{i=1}^{c} P^2(\omega_i|\mathbf{x}) = P^2(\omega_m|\mathbf{x}) + \sum_{i \neq m} P^2(\omega_i|\mathbf{x}) \qquad \text{Minimized when } P_i \\ (i \neq m) \text{ are equal} \\ P(\omega_i|\mathbf{x}) = \begin{cases} \frac{P^*(e|\mathbf{x})}{c-1} & i \neq m \\ 1 - P^*(e|\mathbf{x}) & i = m \end{cases} \qquad \text{(Bayes error)}$$

$$\sum_{i=1}^{c} P^2(\omega_i|\mathbf{x}) \geq (1 - P^*(e|\mathbf{x}))^2 + \frac{P^{*2}(e|\mathbf{x})}{c-1}$$

$$1 - \sum_{i=1}^{c} P^2(\omega_i|\mathbf{x}) \leq 2P^*(e|\mathbf{x}) - \frac{c}{c-1}P^{*2}(e|\mathbf{x})$$

$$- \text{ Error rate } P = \int \left[1 - \sum_{i=1}^{c} P^2(\omega_i|\mathbf{x})\right] p(\mathbf{x}) \ d\mathbf{x} \longrightarrow P \leq 2P^*$$

$$\text{Var}[P^*(e|\mathbf{x})] = \int [P^*(e|\mathbf{x}) - P^*]^2 p(\mathbf{x}) \ d\mathbf{x}$$

$$= \int P^{*2}(e|\mathbf{x}) p(\mathbf{x}) \ d\mathbf{x} - P^{*2} \geq 0 \longrightarrow \int P^{*2}(e|\mathbf{x}) p(\mathbf{x}) \ d\mathbf{x} \geq P^{*2}$$

$$- \text{ Error bound}$$

$$P^* \leq P \leq P^* \left(2 - \frac{c}{c-1}P^*\right)$$

## **Break**

# K近邻的快速计算

- 分类的计算复杂度O(dn)
- 近邻搜索的三种策略
  - Partial distance
  - Prestructuring
  - Editing (pruning, condensing)

Full distance to the current closest prototype  $D^2(\mathbf{x}, \mathbf{x}')$ Terminate computing if the partial square distance is greater than  $D^2(\mathbf{x}, \mathbf{x}')$ 

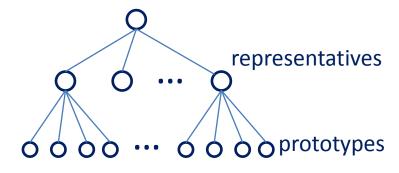

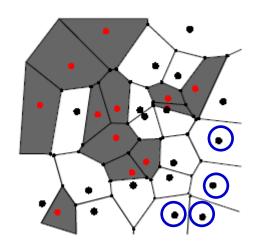

#### Prestructuring

- Search tree, prototypes are linked to the nodes, each labeled with a representative prototype
  - Constructed by clustering, e.g.
- 先找出到x的最近代表点,然后计算与最近代表点连接的原型的距离,找出最近原型
- 可结合partial distance
- 为保证找到最近原型,应从多个 代表点的原型中搜索

#### Editing

 Remove prototypes that are surrounded by samples (Voronoi neighbors) of same class

# 距离度量

## • 距离度量(metric)的性质

non-negativity:  $D(\mathbf{a}, \mathbf{b}) \geq 0$ 

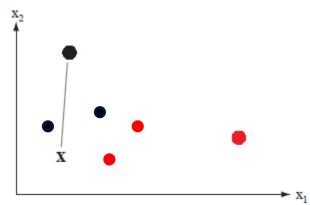

reflexivity:  $D(\mathbf{a}, \mathbf{b}) = 0$  if and only if  $\mathbf{a} = \mathbf{b}$ 

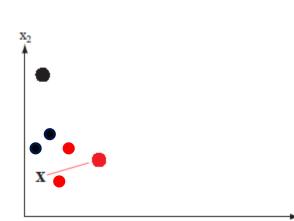

symmetry:  $D(\mathbf{a}, \mathbf{b}) = D(\mathbf{b}, \mathbf{a})$ 

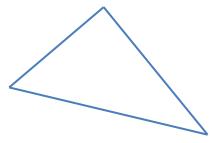

triangle inequality:  $D(\mathbf{a}, \mathbf{b}) + D(\mathbf{b}, \mathbf{c}) \ge D(\mathbf{a}, \mathbf{c})$ 

- 比如, 当特征变尺度

Euclidean metric

$$D(\mathbf{a}, \mathbf{b}) = \left(\sum_{k=1}^{d} (a_k - b_k)^2\right)^{1/2}$$

## • 几种Metric

- Minkowski ( $L_k$  norm)

$$L_k(\mathbf{a}, \mathbf{b}) = \left(\sum_{i=1}^d |a_i - b_i|^k\right)^{1/k}$$

- Manhattan (city block distance): k=1
- Tanimoto metric (for binary features)

$$D_{Tanimoto}(S_1, S_2) = \frac{n_1 + n_2 - 2n_{12}}{n_1 + n_2 - n_{12}}$$

- Metric Learning
  - Parameters in metric optimized in learning (e.g., empirical risk minimization)

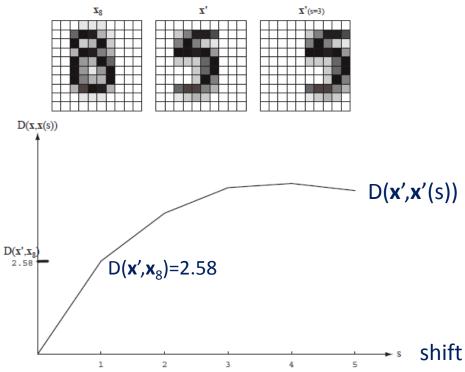

$$D_{\mathbf{w}}(\mathbf{a}, \mathbf{b}) = \sum_{i=1}^{d} w_i (a_i - b_i)^2$$

$$D_{\Sigma}(\mathbf{a},\mathbf{b}) = (\mathbf{a}-\mathbf{b})^{t} \Sigma^{-1}(\mathbf{a}-\mathbf{b})$$

## **Tangent Distance**

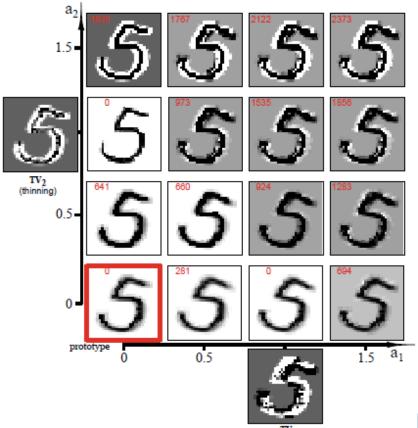

- Image Shape Transformation
  - Shift (translation), rotation, scaling, distortion
  - Distance sensitive to transformation

#### Tangent distance

- Search for optimal parameters for a combination of transformations for a prototype to minimize the distance to test sample
- Parameterized transformation:  $\mathcal{F}_i(\mathbf{x}'; \alpha_i)$
- Tangent vectors:  $\mathbf{TV}_i = \mathcal{F}_i(\mathbf{x}'; \alpha_i) \mathbf{x}'$
- Linear combination in the space spanned by TVs:  $\mathbf{x}' + \mathbf{Ta}$

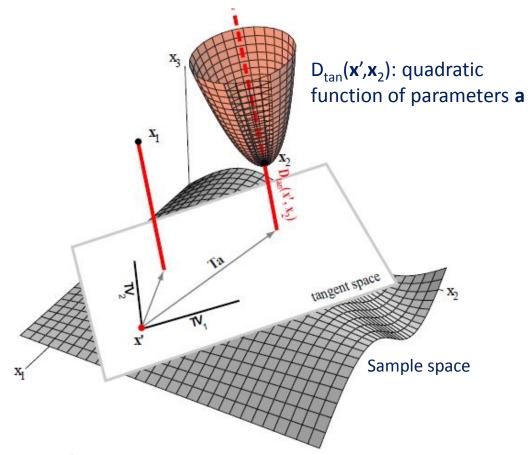

#### Tangent distance

Euclidean distance to tangent space

$$D_{tan}(\mathbf{x}', \mathbf{x}) = \min_{\mathbf{a}} [\|(\mathbf{x}' + \mathbf{Ta}) - \mathbf{x}\|]$$

• Optimization: gradient search

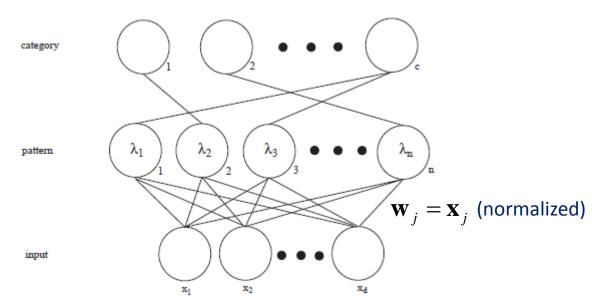

## **Reduced Coulomb Energy Network**

#### RCE Network

 Hidden node (corresponding to a training sample): hypersphere with radius according to the distance to nearest point of different class

$$\epsilon = \text{small param}, \lambda_m = \text{max radius}$$

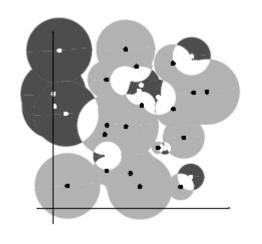

$$\lambda_j \leftarrow \min[\min_{\mathbf{x} \neq \omega_i} D(\mathbf{x}, \mathbf{x}') - \varepsilon, \lambda_m]$$

## • RCE分类规则

- 找出包含x的隐节点(超球体),如果这些节点的类别标号一致,则分类到这个类别
  - 没有节点包含x,或者类别不一致(不同类别超球体重叠)的情况,则拒识

白色区域: ambiguous

## **Approximation by Series Expansion**

- Parzen窗密度估计: 计算量大
- 窗函数用序列展开

$$\varphi\left(\frac{\mathbf{x} - \mathbf{x}_i}{h_n}\right) = \sum_{j=1}^m a_j \psi_j(\mathbf{x}) \chi_j(\mathbf{x}_i)$$

$$\sum_{i=1}^n \varphi\left(\frac{\mathbf{x} - \mathbf{x}_i}{h_n}\right) = \sum_{j=1}^m a_j \psi_j(\mathbf{x}) \sum_{i=1}^n \chi_j(\mathbf{x}_i)$$

$$p_n(\mathbf{x}) = \sum_{j=1}^m b_j \psi_j(\mathbf{x}) \qquad b_j = \frac{a_j}{nV_n} \sum_{i=1}^n \chi_j(\mathbf{x}_i)$$

 $-b_j$ 可离线计算, $p_n(x)$ 只需m次计算(m < n)

## • 高斯窗函数的Taylor展开

$$\sqrt{\pi} \varphi(u) = e^{-u^2} \simeq \sum_{j=0}^{m-1} (-1)^j \frac{u^{2j}}{j!}$$

$$m=2 \qquad \sqrt{\pi} \varphi\left(\frac{x - x_i}{h}\right) \simeq 1 - \left(\frac{x - x_i}{h}\right)^2$$

$$= 1 + \frac{2}{h^2} x x_i - \frac{1}{h^2} x^2 - \frac{1}{h^2} x_i^2$$

$$\sqrt{\pi} p_n(x) = \frac{1}{nh} \sum_{i=1}^n \sqrt{\pi} \varphi\left(\frac{x - x_i}{h}\right) \simeq b_0 + b_1 x + b_2 x^2$$

$$b_0 = \frac{1}{h} - \frac{1}{h^3} \frac{1}{n} \sum_{i=1}^n x_i^2 \qquad b_1 = \frac{2}{h^3} \frac{1}{n} \sum_{i=1}^n x_i \quad b_2 = -\frac{1}{h^3}$$

只有当max|x-x<sub>i</sub>|<h时,展开的近似误差较小,然而这要求h比较大当h较小,使用更多的展开项(m比较大)

# 总结

- 非参数法的基本思想
  - 没有给定概率密度函数形式
  - 基于概率和密度的原始定义,以训练样本的局部分布 近似x的局部密度
- Parzen window
- K-nearest neighbor (k-NN)
  - 1-nearest neighbr (1-NN), Error bound
  - 快速搜索
- 距离度量
  - Tangent distance
- Series expansion

# 下次课(向世明老师)
